

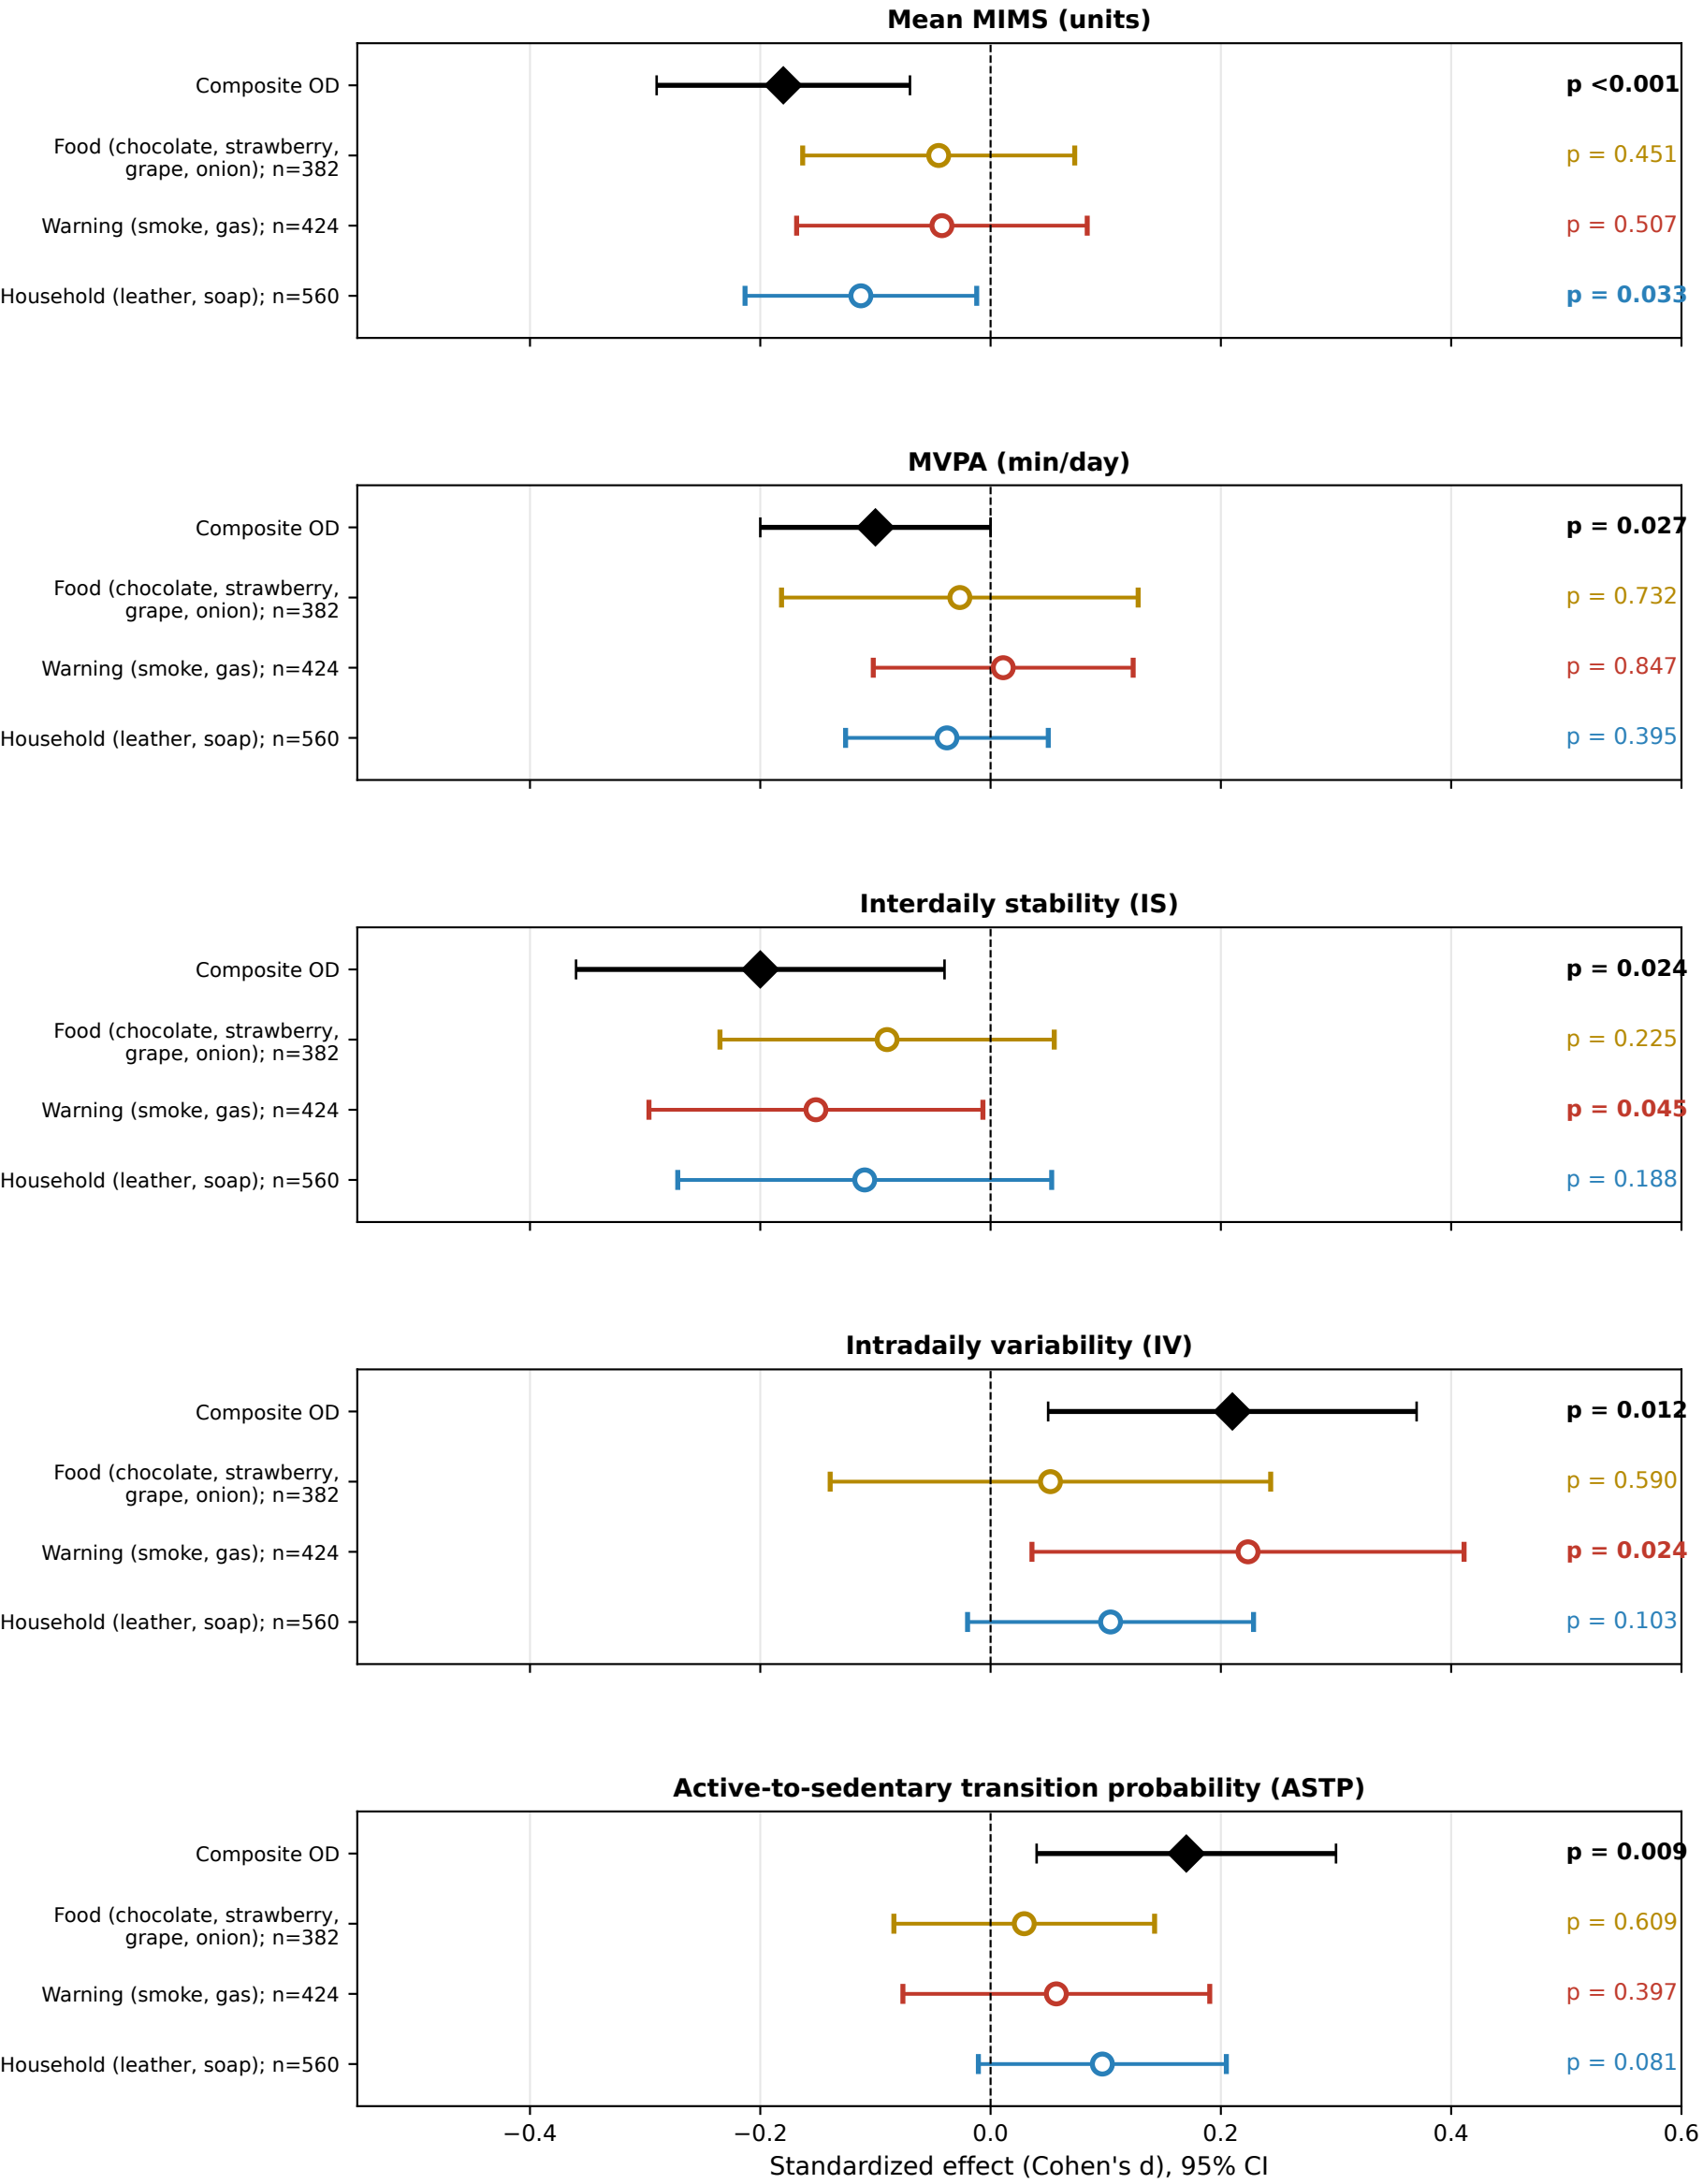

Figure S2. Olfactory dysfunction subtype effects on activity outcomes

M4-adjusted estimates. Composite OD (top row of each panel, black diamond) is the primary exposure (PST ≤5 of 8 correct). Food, warning, and household subtype deficits are mutually exclusive indicators within each odor category. After BH-FDR correction across the 15 subtype × outcome contrasts, no individual subtype contrast survives  $q < 0.05$  (smallest  $q = 0.225$ ). Subtype results are reported as exploratory; bold p-values are  $p < 0.05$  uncorrected.
